

The History of the Early Wilson A2000 The Glove that Changed the Game

Ted Javor, the original designer of the A2000, couldn't be happier, "if you go through the evolution of the baseball glove you can understand why this tool is adored by baseball players," said Javor, the inventor of the most revolutionary mitt in baseball.

The Wilson A2000, named simply after its stock number, entered the sixth decade in 2017. Currently used by nearly 300 major leaguers, the A2000 was the first glove to feature a deep pocket and snap-action hinged palm, the better to catch balls with, plus a triple-lock webbing and a reinforced shell.

'It was a new concept,' said Javor. 'Everything you found in that glove had a functional value. But the most important thing is when you put it on your hand, it fit and was ready to use.'

The A2000 was created with input from ballplayers in the late 1950s, tired of the small, deep-padded gloves that required two-handed catches and did nothing more than protect a player's hand.

Javor said he remembers Manager Paul Richards telling him something had to be done because his catchers couldn't handle Hoyt Wilhelm's knuckleball. Solution: the first oversized hinged catcher's mitt. Simultaneously Al Kaline told the Wilson representatives he needed 'longer fingers because I liked to catch the ball high in the web as opposed to what was then a small pocket.' Solution: the A2000.

In 1957, the first A2000 was introduced and grabbed by players like Ted Williams, Ernie Banks, Nellie Fox and Kaline.

'Everybody wanted one,' Kaline said. 'There was a mad rush when they brought them out in spring training.'

'The A2000 gave you so much confidence, particularly when you had to catch the ball with one hand,' said the Hall of Famer. 'You didn't have to worry about a small area in your palm to catch the ball like you did with the other gloves. Now you had a web all the way down to the heel and a deep, soft pocket in the middle.'

'And when you reached to make the catch, the glove seemed to automatically collapse around the ball.'

Javor said he remembers when the idea of creating the Snap Action hinge came to him: he was eating lunch and began to study a door hinge.

'These guys (ballplayers) jump up now to make a catch and the web is so flexible, it's like a bear trap,' Javor said.

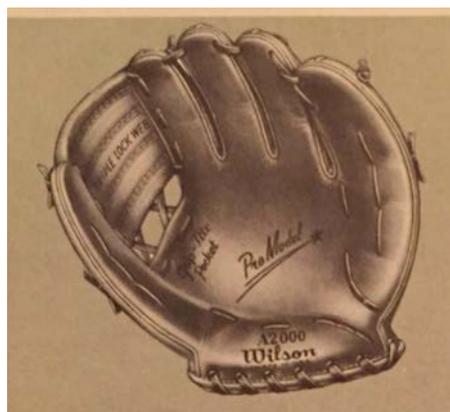

In the spring of 1957 Wilson decided to build a better glove and would ask the players to help build it. Glove fitters arrived in all spring training camps to research what

improvements players needed. The fitters took their leather-making tools to the camps. They met with players and cut and designed gloves on the spot. Then the designers returned to the plant and began to create what was to become an American Classic. The features the A2000 incorporated remain little changed today. The pocket was moved to the base of the web. The web was widened and the pocket lengthened, which made it easier for the fielder to catch and secure the ball. A Snap Action feature allowed the player to get the ball out of the pocket quickly. The fiber-reinforced thumb made the glove stiffer than the floppy, older gloves.

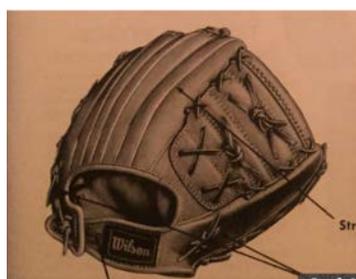

Lefty Gomez led the Wilson team that promoted the A2000 to major league players. With the open face design the glove appeared larger than it really was, Gomez was summoned to the office of the American League President Joe Cronin to do some explaining. Gomez managed to convince Cronin that the apparent extra size was only an optical illusion.

1958

The Glove that forever has changed the game and helped make Wilson the choice of Major League Baseball. It was also the first glove designed by and for major league players. The A2000/A2100 were the first gloves not to be shaped like the human hand. This original model introduced the 3/4 Triple-Lock web with double X lacing at the bottom of the web, the Snap Action hinge and the Grip Tite Pocket that extended to the bottom of the palm. Rectangular patch, Pro Model Shooting Star logo on the palm and Major League on the thumb. The A2000 was a non endorsed model for the Professional Player, the A2100 was the Johnny Antonelli endorsed model.

1959 Introduced the solid full barrel Triple Lock web. Distinguished from later A2000 models in that it does not have a spiral laced web. This model again is X laced at the little finger. Rectangular patch and Pro Model Shooting Star logo in the palm.

1960/61

For stability a spiral laced web has been added to the full barrel web and all the fingers are now X laced. A new finger loop was added to the back of the index finger. Nelson Fox, a Wilson endorser, supposedly encouraged Wilson to make a smaller version of the A2000 which became the A2001 in 1960.

The only difference between the 60/61 models is that the 1961 glove has a U laced heel.

1962

Same web as 1960, the 61 model had a U heel design and the 62 has an L laced heel design. A2000 is stamped on the heel and still has a rectangular patch and Pro Model Shooting Star logo. There is a circular Made in the USA stamped at the base of the thumb. The 1962 A2001 may be the finest infield glove ever created.

1963/64

Introduced the dual hinged web that will become the iconic standard A2000 web in the 70s and 80s. Vertical dual criss cross lacing in the web design. The dual hinged web can still be seen on the gloves of many MLB pitchers. Pro Model Shooting Star logo still remains. The only difference between the two years is that the 64 model introduces a circular patch on a wider contour wrist strap.

1965

Wilson comes out with two separate A2000 models. The 1964 dual hinged web with X lacing with the circular patch returns and a new open web model is introduced with a circular patch and Pro Model Shooting Star logo. The open web glove is extremely rare and was a one year experiment.

Wilson in 1966 decides to change the web design. This model now has a single hinged web with vertical criss cross lacing or sometimes referred to as a Twin Web. This web was not as flexible as the iconic dual hinge web. The glove still has the circular patch and Pro Model Shooting Star logo.

1967/68

The gloves return to the dual hinge web now interlocked rather than X lacing down each hinge that was introduced in 1963. Interlocked hinge would remain a staple in future A2000s. A vertical The A2000 is stamped on the center of the web. The circular wrist patch remains but the Pro Model Shooting Star logo is retired. In 1967 the Wilson W with The A2000 across it was stamped into the pocket. This makes this glove a collector model, this stamp was only used on the 1967 glove. The 1968 model added a circular stamp around the Wilson W and The A2000 logo. Also introduced to both gloves was a leather overlay at the base of the palm. This may have been an attempt to resemble the Rawlings Dual Step Down Palm. I used this model both my junior and senior year in college. It is a fine glove and was capable of use in both infield and outfield play.

1969

The glove continues to use the interlocking web and the circular stamped logo in the palm. The change is the A2000 now will come in three sizes the XLC, XL and the L models. The A2001 is discontinued and now becomes the A2000 L. The model is stamped down the center of the web. The circular logo is moved from the wrist to below the thumb. The leather overlay has been also discontinued. Pictured below is an A2000L.

Oversized catcher's mitt banned in 1963.

Let's now examine the two current Wilson top of the line gloves, A2K and the A2000.

While both glove series are high-quality, feature Wilson's signature patterns, and patent dual-welting, but they are not the same. Here are the main differences between the A2K and A2000 gloves:

- Price -- With three times more hand-shaping by master technicians, A2Ks are more expensive than A2000 gloves. The average cost of a new Wilson A2K glove is \$360, whereas a new A2000 is \$260.
- Leather -- A2000 gloves use American steer-hide, Pro Stock leather for a more workman-like feel. A2K gloves are made from Pro Stock Select leather that is three times thicker, stronger, and tighter; thus, softer.
- Liner -- A2Ks own a softer liner, so it tends to be more comfortable. A2000s are comfortable and usually have a Dri-Lex wrist lining, but A2K does the same while softening even more.
- Craftsmanship -- Wilson glove technicians spend 3x more time on A2K crafting than A2000. The extra time is noticeable with A2Ks softer leather and less time to break-in.
- Durability -- **A2000 gloves** are highly-regarded for a reason. That said, A2K (due to craftsmanship and leather) are known for their long-term durability.
